

Skin Thickness

The facial skin along the brow bone is not the same thickness throughout. The thickness/thinness of the skin will affect how the ink settles into the skin and how long the tattoo will last.

- **Thinner Skin**- a tattoo in these areas will last longer and will remain crisp.
- **Thicker Skin**- a tattoo in these areas areas will fade more quickly.

- **Area 1**- This area contains the thinnest skin. This area is easy to tattoo and will retain pigment/ strokes well.
- **Area 2**- This area usually contains more dense hair and more oils than other parts of the eyebrow, with medium thickness. This area will be more difficult to tattoo and won't retain the pigment/ strokes as well.
- **Area 3**- This area is contains medium to average thickness. This area will be easier to tattoo and will retain pigment/ strokes well.
- **Area 4**- This area contains thick skin and will be easy to tattoo
- **Area 5**- This area contains thick, tough skin. The sun hits this point of the eyebrow first, be sure to go over your work in this area to ensure the pigment is retained.
